

Profile Maintenance

Atrim profiles do not require any special maintenance.

Once the profile has been fitted wipe immediately with a damp cloth before the adhesive or grout has dried.

Profiles can be included in standard cleaning regimes, wiped with a soft damp cloth and can include the use of common domestic surface cleaners and antibacterial sprays.

Stainless steel surfaces exposed to the environment or aggressive substances should be cleaned periodically using a mild household cleaner. Regular cleaning maintains the neat appearance of stainless steel and reduces the risk of corrosion. All cleaning agents must be free of hydrochloric and hydrofluoric acid and chlorides.

Stainless steel surfaces develop a sheen when treated with a chrome-polishing agent.

Oxidation films on exposed solid brass or aluminium can be removed by using a conventional polishing agent, but will form again. This is due to the raw metal material and how it reacts in the environment naturally.

Do not use harsh chemical detergents, abrasive cleaning agents or mechanical implements, as this will damage the surface finish and can distort the profile.
